Putting Users and Small-Scale Creators First in Canadian Copyright Law and Beyond

A Brief Submitted By:

The Cultural Capital Project: Digital Stewardship and Sustainable Monetization for Canadian Independent Musicians

Presented to:

The Standing Committee on Canadian Heritage

Remuneration Models for Artists and Creative Industries

December 10, 2018

Our submission comes from a research team that includes:

- Dr. Brian Fauteux, Assistant Professor of Music at the University of Alberta
- Brianne Selman, Scholarly Communications and Copyright Librarian at the University of Winnipeg
- Dr. Andrew deWaard, PhD in Cinema and Media Studies at UCLA

And research assistants:

- Dan Colussi (University of Winnipeg)
- William Northlich (University of Alberta)
Introduction

In an industry characterized by market consolidation, an imbalance of power between creators and big businesses is one of the largest factors that prevents fair remuneration for creators. Proposals for legislation that do not address this imbalance may worsen the conditions for working musicians. While legislation that supports users rights may offer some mitigation of the effects of this industry concentration, copyright is generally an inefficient tool for protecting artists and encouraging innovation. Artists are not always the rights holders for their creative works and thus legislation for rights holders does not inherently help artists. By encouraging creativity, user rights are more empowering for everyday creators and can help balance the concentration of power enjoyed by the large industry players.

Our submission comes from a research team that is working on a SSHRC Insight Grant funded project titled “The Cultural Capital Project: Digital Stewardship and Sustainable Monetization for Canadian Independent Musicians.” The project investigates issues of fair payment for creators, as well as ways to encourage new and creative artistic production.

The following recommendations aim to represent the interests of everyday users and smaller scale musical creators and hope to provide a diversity of position.

1. Recognize that increasing market consolidation is at odds with a vibrant and diverse music industry.

Increasingly, copyright as an exclusive right has been effective at building up assets for oligopolies, and the concentration of these assets provides a barrier to new and innovative players in the cultural industries. Canadian musicians and users are at the mercy of non-Canadian media and tech companies: Universal, Sony, and Warner control roughly 86% of the North American recording and publishing market.¹ LiveNation and AEG monopolizes the live concert and ticketing business;² iHeartMedia, Cumulus, and the private equity companies invested in them have amassed large terrestrial radio station groups and driven them into bankruptcy;³ SiriusXM dictates the satellite radio market and has just purchased Pandora; and the digital streaming media sector has come to be dominated by Apple, Google, Amazon, Netflix, and Spotify.

The stunning inequality among musicians is getting worse: the top 1% of artists account for 77% of all recorded music income,\(^4\) while the 10 top-selling tracks command 82% more of the market and are played almost twice as much on Top 40 radio than they were a decade ago.\(^5\) This consolidation of listening habits has the effect of reducing the diversity of music: a recent report on Spotify’s most-streamed artists in 2018 indicates that all of the top artists are men.\(^6\)

The Canadian Media Concentration Research Project notes that vertical integration within Canada “is very high by historical standards and almost four times current levels in the United States.” In Canada, Bell, Rogers, Telus, Shaw, and Quebecor accounted for 71.1% of the $80 billion network media economy in 2016.\(^7\) As President of Re:Sound Music Licensing, Ian MacKay, noted: in 1997, 50% of the Canadian radio sector was in the hands of 10 radio groups; it is now 82%, leading to homogenized playlists and limited exposure for new musicians.\(^8\)

Massive profits are being made in the media landscape, little of which makes its way to artists and performers. A recent Citigroup report found that the U.S. music industry generated $43 billion last year, but artists received only 12%.\(^9\) This market consolidation, combined with vertical integration (where tour promoters are owned by radio stations are owned by record labels) makes it harder for both creators and users to be exposed to diverse and remunerated cultural goods.

This is not to say that Canada does not enjoy a diversity of artists and musical styles that have been supported, in some cases, by Canadian industries and intermediaries. The Polaris Prize, as an example, has support from a range of sponsors including the CBC, the Government of Canada, FACTOR, and Slaint Communications, and over the past five years has been awarded to artists with an exceptional range of sounds and styles: Jeremy Dutcher (2018), Lido Pimienta (2017), Kaytranada (2016), Buffy Sainte-Marie (2015), and Tanya Tagaq (2014).

One further issue heightened by market consolidation is the collection and monopolization of user/listener data. Platforms are increasingly able to collect and monetize citizens’ private usage data, usually in a way that is not transparent to listeners themselves. Listening data has value, similar to the data and knowledge generated by academic research and in cases where public funds have gone into programs/projects, this data should have the same requirements of openness as research data. In both the Heritage and INDU committees, the lack of market data to inform decisions is evident.

Market Consolidation Recommendations:

1. Antitrust regulation should be pursued to protect a diverse marketplace, not just to ensure competitive pricing.

2. Increase public funding and support dedicated to smaller creators who are more likely to be squeezed out by market consolidation.

3. Increase collaboration with other governments recognizing the importance of protecting diversity, like the Joint Declaration on Cultural Diversity and the Digital Space with France,\(^\text{10}\) the “international grand committee” of Canadian and British parliamentarians that are investigating American tech companies,\(^\text{11}\) and the EU’s actions against Amazon, Facebook, and Google for anticompetitive practices.\(^\text{12}\)

2. Recognize that user rights and the creative commons have value for Canadian creativity and culture and that these should be protected.

Cultural works in the public domain/creative commons encourage access to information and culture, which inspires further creative work and lessens boundaries between users and creators. We encourage a consideration of the value of having musical works in the creative commons and advocate for legislation that is in line with contemporary cultural practices and technological realities (including online activities such as music sharing, fandom, and remix culture).

Protecting the rights of people to use and create culture in noncommercial ways is crucial to protecting the public domain. We caution against the technological optimism shown in the recent EU copyright changes, which encourages the enforcement of copyright law by technological algorithm.\(^\text{13}\) Suggestions made by Canadian industry to protect against piracy, like site blocking and deindexing without court oversight in the “FairPlay” proposal, would involve undue intrusion and preemptive control over spaces where cultural appreciation and production occur. This ‘chill’ - the fear of every day citizens and creators to engage in cultural sharing, appreciation, and innovation - has a direct effect on reducing creativity and participation in cultural production.

There are compelling initiatives in spaces that are not entirely restricted by copyright. Capital City Records at the Edmonton Public Library is one example of a digital public space that has local creators make their music available for anyone with a library card. The library provides artists with an honorarium and makes content available for permanent download and streaming, with artists retaining

\(^{13}\) We agree with the analysis of copyright as a crude mechanism found in Public Interest Advocacy Centre, "Brief of the Public Interest Advocacy Centre to the Standing Committee on Industry, Science and Technology’s Review of the Copyright Act", June 1, 2018. https://www.ourcommons.ca/Content/Committee/421/INDU/Brief/BR9947628/br-external/PublicInterestAdvocacyCentre-e.pdf
rights to their content which can still be shared and sold anywhere else. Such an example highlights ways that listeners, artists, and cities can be connected through non-commercial, public spaces. Moreover, such a space is able to make use of the internet and digital technology in a way that circumvents unfair power dynamics and concentration in the media industries.

Treating the general public like pirates is unfair, especially after opening the space for legal options like Netflix and Spotify (as well as the myriad of independent options that exist). There are now affordable and accessible options for everyday users to watch and listen to cultural texts. The additional costs of aggressive regimes of copyright enforcement provide barriers and costs for new entrants into the market. Small creators would disproportionately feel the burden of this style of regulation. Instead, we encourage efforts to provide artists with higher payout rates via streaming and online music services.

Public Rights Recommendations

1. Retain limits to statutory damages for non-commercial infringement, so that individuals aren't faced with undue fear of exercising user’s rights.
2. Protect the current notice-and-notice system and strengthen it to protect against misuse/spurious claims.
3. Continue rejecting industry sponsored proposals for site blocking and de-indexing, which disproportionately harm small producers and the general public, for the gains of only a few large industry players.

3. Consider automatic rights reversion as a way to mitigate the ill effects of term extensions.

In the music industries many artists are deriving revenue from copyright adjacent activity. Much artist revenue has to be sustained by aggressive touring, an option that is not accessible to everyone and one that is difficult given Canada’s vast geographical area. A Future of Music study found that the income derived from sound recordings is a small part of a musician’s overall revenue pie and is decreasing, although sound recordings are “valuable for other reasons, serving as an artifact of creativity that can [be] used to leverage other income sources” including live performance. From 5,371 survey respondents, “the aggregated percent of income derived from sound recordings [over] 12 months was 6%.” Specific genres with noted decreases in income from sound recordings included rock.

15 Public Interest Advocacy Centre, “Brief of the Public Interest Advocacy Centre to the Standing Committee on Industry, Science and Technology’s Review of the Copyright Act,” Our Commons, June 1, 2018. https://www.ourcommons.ca/Content/Committee/421/INDU/Brief/BR9947628/br-external/PublicInterestAdvocacyCentre-e.pdf
and jazz.\textsuperscript{19} Further, two-thirds, or 66\%, of respondents “reported that 0\% of their income was derived from sound recordings.”

Another study\textsuperscript{20} found that, “on average, just 14\% of sound recordings published between 1890 and 1964 had been re-released by right holders on compact disc. Non-right holders re-released twenty-two percent of those recordings without the benefit of any monopoly rights—over fifty percent more than those that did.” It is worthwhile to consider how works in the public domain enjoy greater commercialization and dissemination than titles with restricted rights. A term extension risks preventing a vital public sphere to the benefit of major record labels, who would further exploit an artist’s work after their death.

Term extensions do not hold up to scrutiny in cultural economic theory.\textsuperscript{21} Most of the commercial value of a sound recording is extracted in the first 10 years, so a 70 years after death term provides no real additional incentive.\textsuperscript{22} A group of economists demonstrated how the time value of money affects investment incentives, explaining that by assuming “a real interest rate (net of inflation) of seven percent, they showed that a dollar today is worth $0.93 if received in a year, just $0.0045 if received in eighty years and a mere $0.0012 if it’s going to take a century to end up in one’s pocket.”\textsuperscript{23}

The future value of a dollar bears a striking resemblance to the current per-stream rates paid out by major music streaming services, rates that are decried by numerous artists (recent statistics\textsuperscript{24} indicate a per-stream rate of $0.0038 on Spotify and $0.0007 on YouTube). As Liberal MP Randy Boissonault expressed in a question to SiriusXM Canada, “to make $2,400 a month, which is the minimum wage here—an Alberta wage is $15 an hour—it would take 16.5 million hits on one streaming site and it would take 9.8 million hits on another streaming site for one artist to make $2,400 in one month. That’s 180 million hits just to make a living wage for the year.”\textsuperscript{25} By considering cultural depreciation and by discounting the value of future earnings, “it becomes clear that the period of exclusivity necessary to incentivize initial creation of even the most expensive works is far shorter than current copyright terms.”\textsuperscript{26}

\textsuperscript{19} “Mythbusting: Data Driven Answers to Four Common Assumptions About How Musicians Make Money,” The Future of Music Coalition. \url{http://money.futureofmusic.org/mythbusting/4/}
\textsuperscript{20} “One consideration by Congress in extending copyright protection to owners for such a long period was to give those owners an incentive to reissue, and thereby preserve, older recordings.” Tim Brooks, Library of Congress, Survey Of Reissues Of U.S. Recordings V, 2005. \url{https://perma.cc/4ZX2-SSW8}
\textsuperscript{26} Rebecca Giblin, “A New Copyright Bargain? Reclaiming Lost Culture and Getting Authors Paid,”
Copyright term extension is now reality in Canada. To mitigate the ill effects of the term extension we strongly encourage a careful consideration of automatic rights reversion, with rights reverting back to authors after a period of no greater than 25 years. This echoes other arguments that have been put forth in favour of reversion, including Bryan Adams advocating for rights reversion with the ability of creators to reclaim ownership of creations 25 years after they have been given away. This recommendation offers some balance to the historically imbalanced relationship between artists and record labels, where creators are often pressured to sign away their rights for life.27

With rights reverting back to creators, they would have the ability to dedicate works to the creative commons or engage in direct licensing. Additionally, it would enable creators to enter into renewed or revised contracts, which would be beneficial if a work was to be adapted or re-released.

Key to creators being able to exercise these rights is clarification that these rights cannot be contracted away. Record labels, publishers, and platforms should not be able to add contractual stipulations that override creators’ moral rights, or a hypothetical reversion right. Rights reversion could be used to further fund the production of music through direct selling to listeners or serve as a retirement fund for musicians, lessening the precarity of artists’ futures.

**Rights Reversion Recommendations**

1. Copyright Act Amendment that provides for automatic rights reversions to creators after 25 years.
2. Clear language in the Copyright Act that prevents contractual override of rights granted in the Act.28

4. Support vibrant arts communities through direct funding and policies other than applying new limitations via the Copyright Act.

Public funding is crucial for independent Canadian creators. One example29 of this is the additional $2.5 million in funding that has been committed to FACTOR by the Department of Canadian Heritage for funding the export of independent Canadian music. However, sometimes the requirements for grants can unfairly restrict against smaller artists/labels.30

---

Copyright related revenue for independent musicians is generally quite low. The *Future of Music* study\(^{31}\) indicates that musicians are making less money on recorded music sales for multiple reasons. Royalty payments are becoming based more on sales of singles than albums, and now that streaming has overtaken the sale of digital downloads, dismal per-stream rates are a dwindling source of revenue. There is a drop in record label support as artists now pay for things that labels used to, and musicians must perform branding and marketing roles themselves. One example involves Jack Conte and Nataly Dawn, who made “viral, entertaining covers of popular hits” to then make sales from both covers and originals to compensate for making “less than tens of dollars” from streaming services.\(^{32}\) The majority of artists, instead, “rely on an ever-shifting composite of income sources based on their compositions, sound recordings, performances, brand, and their knowledge of their craft.”\(^{33}\) Public funding can fill these gaps and promote access to diverse and exciting Canadian content.

However, we are extremely wary of cultural funding falling on users in the form of a smartphone tax. The variety of uses for these devices are numerous and the vast majority of these uses are going to be for necessary connectivity, not piracy related activities.

To help Canadian independent artists, the Government should prioritize strong connections and relationships with provincial and municipal governments, particularly when it comes to policies and initiatives that fund and support live music venues, small record labels, do-it-yourself and artist-run spaces, and campus and community radio stations. Living in a “music city” has its benefits with respect to financial opportunities that are open to artists, enabling one to more readily make a living for oneself, but these locations often have a higher cost of living.\(^{34}\)

In Canada, we have seen issues with balancing “music city” initiatives with increased costs of living, especially in large cities like Toronto. One 2018 article\(^{35}\) highlights a “venue crisis” in the city as live music venues, namely smaller venues, struggle to sustain themselves and remain open. This points to two challenges: 1) Ensuring that larger urban centres do not only cater to superstars and megatours; and, 2) Enabling smaller and mid-sized Canadian cities to also provide resources and support for live music initiatives. It is imperative that live music can be programmed and promoted by a variety of organizations and that live music events are affordable and easy to attend.

Public Arts Funding Recommendations

1. Any device or user taxes that are implemented to support culture should be progressive and not unduly impact lower income citizens.
2. Increased public funding of new and emerging artists and labels, with fewer restrictions on label size and distribution, and lifetime caps for larger labels.
3. Increased support for local initiatives that support musicians and communities.
4. Support provincial and municipal models of funding and support that recognize the shifting nature of artist income streams.

Conclusion

Waterloo-born musician Danny Michel has recorded 13 albums in the last 25 years, building a career and a comfortable living from his music without having written a ‘hit song.’ In a confessional social media post, he revealed that his album sales revenues dropped by an astounding 95% in 2018 due to the transition to streaming services. Michel is now wondering how long he can remain a musician. He is not alone. Based on conversations with many other lifelong musicians, Michel notes a deep, shared anxiety among working musicians about the ability to continue making ends meet in the digital music industry. “Bands/musicians are downsizing, recording at home, cutting corners where ever they can,” Michel laments. “Studios are losing business. Session musicians, techs, administration, grant writers are all losing work. And with every band in the world back on the road, venues are clogged and ticket prices have tripled. For me it means being away from home and taking on more work than I ever have.” Sadly, Michel’s story is not uncommon in today’s cultural industries, which are becoming an increasingly unequal playing field with downward pressure on labour. Michel ponders whether “the expiration date on music” is coming. Government action can prevent that dismal day from ever arriving.

The main principles we would like to see applied by both the Heritage and INDU Committees, when it comes to legislating and regulating the music industry in Canada, are:

1. Recognize that increasing market consolidation is at odds with a vibrant and diverse music industry.
2. Recognize that user rights and the creative commons have value for Canadian creativity and culture and that these should be protected.
3. Consider automatic rights reversion as a way to mitigate the ill effects of term extensions.
4. Support vibrant arts communities through direct funding and policies other than applying new limitations via the Copyright Act.

We think that the specific recommendations given in each section may help to protect a vibrant and diverse Canadian artistic community, while providing more opportunities for independent creators to share in the profits from the industry.
